Intel Neuromorphic Research Community Spring 2022 Workshop

Legal Information

Performance varies by use, configuration and other factors. Learn more at www.Intel.com/PerformanceIndex.

Performance results are based on testing as of dates shown in configurations and may not reflect all publicly available updates. See backup for configuration details. No product or component can be absolutely secure.

Your costs and results may vary.

Results have been estimated or simulated.

Intel technologies may require enabled hardware, software or service activation.

Intel does not control or audit third-party data. You should consult other sources to evaluate accuracy.

Intel disclaims all express and implied warranties, including without limitation, the implied warranties of merchantability, fitness for a particular purpose, and non-infringement, as well as any warranty arising from course of performance, course of dealing, or usage in trade.

Welcome!

To Our Second Fully Virtual INRC Workshop

Fall Workshop in Graz, Oct 2019	Winter Workshop Feb 2021	Spring Workshop April 2022
Face-to-face	Webex	Teams
100 Attendees	350+	700+
Barely any recorded content	Nearly all content recorded	Nearly all content recorded
Most sessions closed to formally engaged members	Most sessions open to the broader community	Nearly all sessions open to the broader community
PDF agenda	Event website	Event website
Hallway chats, lunches, dinners	Slack	Slack
Acoustics problems	Connection problems	We will see...

(Next one hybrid – fingers crossed)

Workshop Goals

Long-time INRC Members	New Neuro Researchers	New Industry Participants
~40%	~40%	~20%
Learn about our new tools (Lava, algorithmic libraries, and Loihi 2) and how to start developing		
Learn and share new results, ideas, and developments with Loihi and the broader community		
Make new connections for collaboration		
Get up to speed on background (“first era” of Loihi research)		Share needs and identify compelling business opportunities

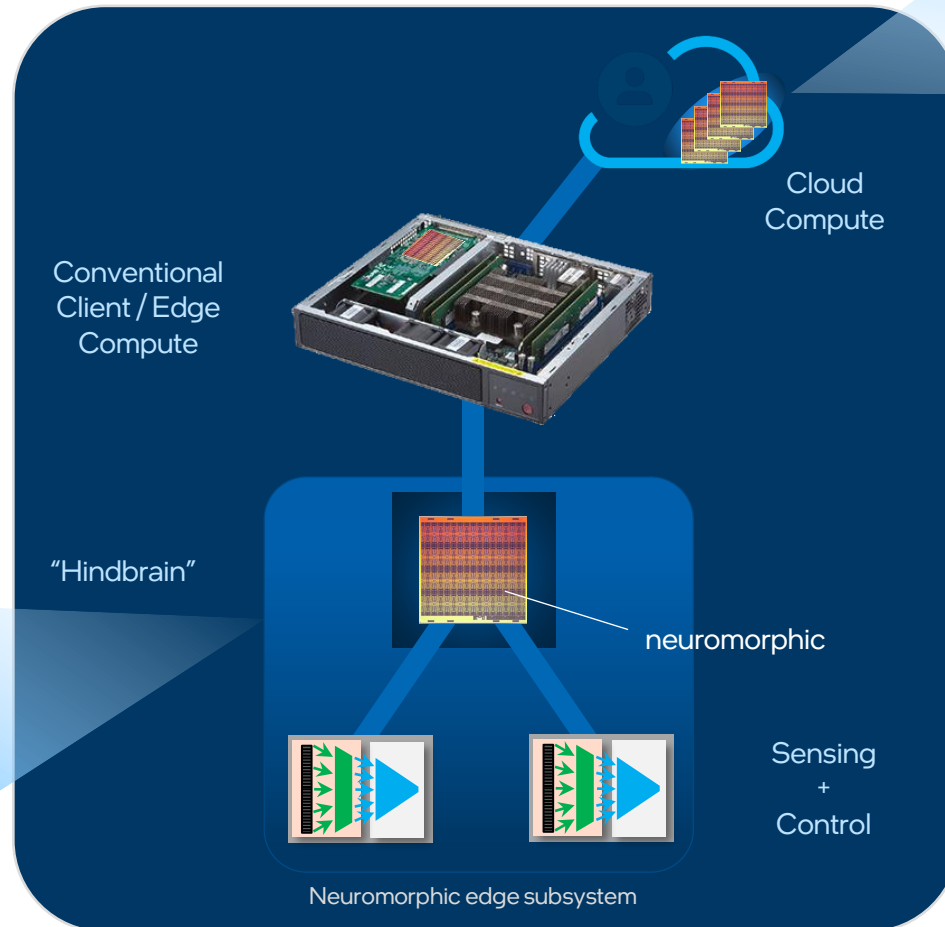

Time (PDT / CET)	Session	Speakers
8:00 / 17:00	Welcome: Workshop kick-off	
8:05 / 17:05	New Tools for a New Era of Neuromorphic Computing	Mike Davies
8:40 / 17:40	Loihi 2	
8:55 / 17:55	Lava	Mike Davies, Andreas Wild
9:40 / 18:40	Workshop and Community Orientation	Tim Shea + WG leads
10:00 / 19:00	Q&A / Break	
10:30 / 19:30	Featured Community Results	
10:35 / 19:35	▪ Alien vs Terminator: D-Wave vs Loihi	Garrett Kenyon, LANL
10:52 / 19:52	▪ Monte Carlo Simulations on Loihi	Brad Aimone, Sandia
11:09 / 20:09	▪ Loihi in Orbit: the First 90 Days	Michael Lowry, NASA
11:26 / 20:26	▪ The Backpropagation Algorithm Implemented on Loihi	Alpha Renner, LANL
11:43 / 20:43	▪ VSA With Phasor Neurons on Loihi - Towards Neuromorphic Visual Odometry	Alpha Renner, ETHz/INI
17:00 / 02:00	Loihi 2 Deep Dive	Garrick Orchard

Our Goal

Develop a new programmable computing technology inspired by the modern understanding of brain computation

Integrate neuromorphic intelligence into computing products at all scales

Achieve brain-like efficiency, speed, adaptability, and intelligence

What is Neuromorphic Computing? A Huge Bottom-up Exploration Space

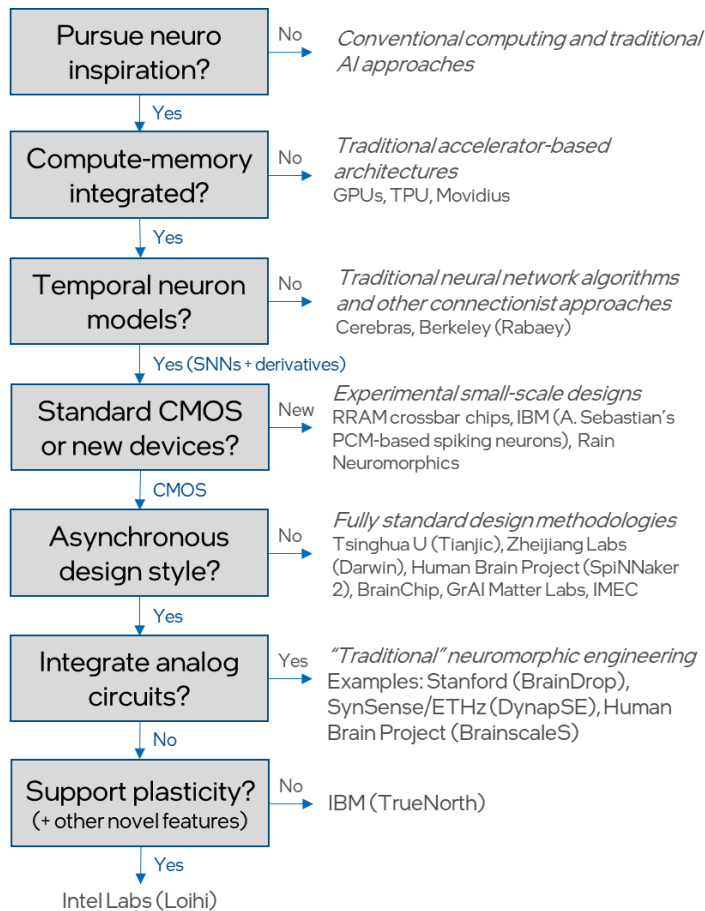

Self-organized growth
Autonomous healing
Exploiting material time constants
Oscillatory dynamics
Stochasticity
Local learning rules
Very high fanout
Distributed data representations
Fine-grain parallelism
Temporal data coding
Sparse temporal activity ("Spikes")
Sparse connectivity
3D wiring
Recurrence and feedback loops
Compute-memory integration
Analog-valued persistent state
Online causal adaptation
Low precision
Dynamics on diverse time scales
Hybrid analog/digital computation
Continuous time operation
Parametric Heterogeneity

Increasingly exotic or
uncommon properties in
conventional computing
systems

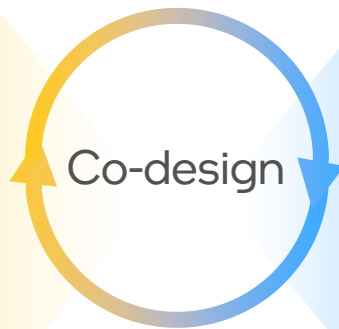

Our Approach: Iterative architecture-algorithms co-design

Neuro-Inspired Silicon

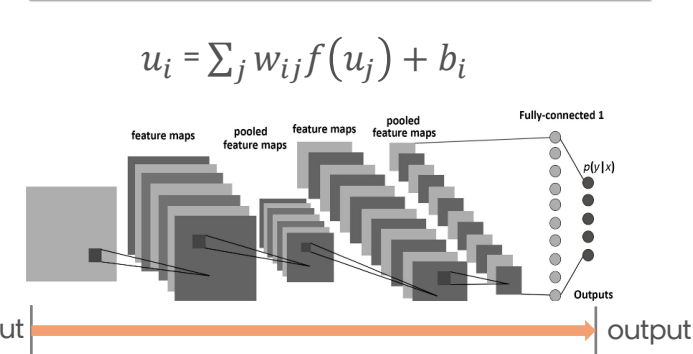

Novel Neuro-Inspired Algorithms

Category	Example applications
Deep learning: backprop-trained event-based DNNs	Object and gesture recognition for event-based vision sensors, slip detection for event-based tactile sensors, ANNs with sparsely changing input data
Deep learning: DNNs with online adaptation	Few-shot new gesture learning, Adaptive control,
Vector Symbolic Architectures (VSA), aka Hyperdimensional Computing (HDC)	Semantic factorization, relational reasoning, symbolic and analogical reasoning
Neural Engineering Framework (NEF)	Adaptive control systems, state machines
Dynamic Neural Fields (DNF)	SLAM, object tracking, dynamic control, attention
Neural sampling e.g. spiking Boltzmann machines	Constraint satisfaction, probabilistic inference
Oscillatory computation	Optimization, event-based spectral transforms, optic flow, audio spectral normalization
Recurrent Excitation/Inhibition-balanced networks	LASSO regression, sparse feature coding
Event-based networks with temporally coded information	Graph search, similarity search

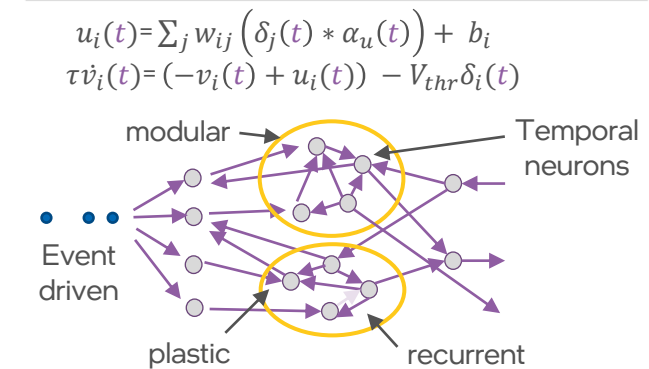

Rigorous Benchmarking

Conventional Deep Networks

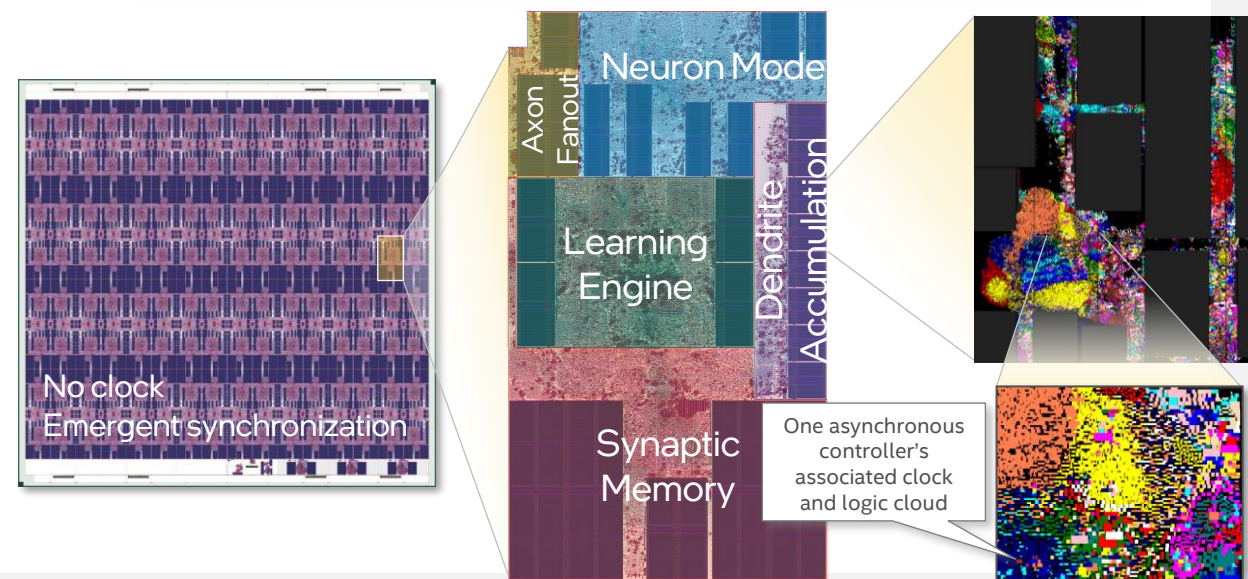

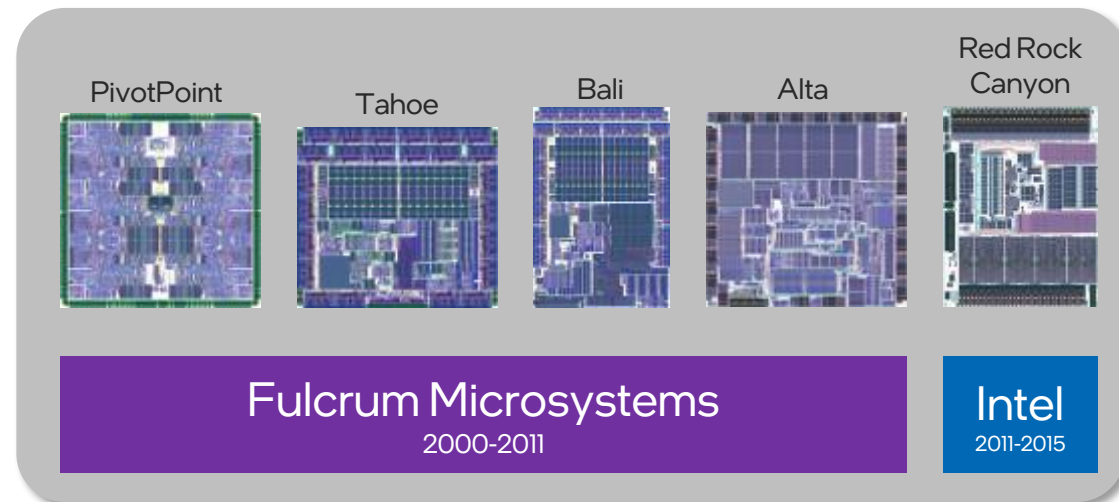

Neuromorphic Networks

Chip implementation with asynchronous design

- Commercially developed over 2000-2015 at Fulcrum Microsystems and Intel
- Applied to five generation of commercial Ethernet switches
- Power consumption scales with activity – matched for spiking neurons and sparse interconnect
- Low latency communication – enables scaling to large systems
- Allows neuromorphic mesh to operate over 1000x faster than biological speeds using emergent synchronization
- Supports low energy, highly-ported SRAM arrays

Sparse, asynchronous communication is fast

Leads us to a new class of computer architecture

Standard Computing

PROGRAMMING BY ENCODING ALGORITHMS

SYNCHRONOUS CLOCKING

SEQUENTIAL THREADS OF CONTROL

```

if X then
...

```

Parallel Computing

OFFLINE TRAINING USING LABELED DATASETS

SYNCHRONOUS CLOCKING

PARALLEL DENSE COMPUTE

Neuromorphic Computing

LEARN ON THE FLY THROUGH NEURON FIRING RULES

ASYNCHRONOUS EVENT-BASED SPIKES

PARALLEL SPARSE COMPUTE

Realized in Loihi

KEY PROPERTIES

Compute and memory integrated
to spatially embody programmed networks

Temporal neuron models (LIF)
to exploit temporal correlation

Spike-based communication
to exploit temporal sparsity

Sparse connectivity
for efficient dataflow and scalability

On-chip learning
without weight movement or data storage

Digital asynchronous implementation
for power efficiency, scalability, and fast prototyping

Yet...

No floating-point numbers
No multiply-accumulators
No off-chip DRAM

Fundamental to
deep learning hardware

Zooming in on the best examples: Optimization problems

What features best explain the sensory input?

$$\underset{z}{\operatorname{argmin}} \|x - Dz\|_2^2 + \lambda \|z\|_1$$

Input Reconstruction Sparse regularization

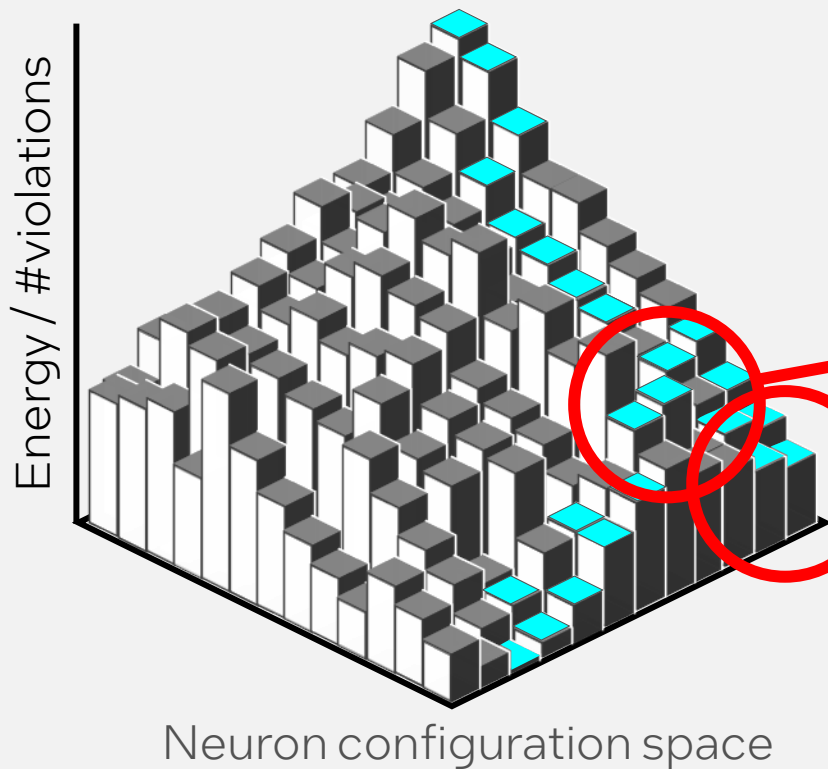

What is the shortest path to my goal?

What is the shortest path while visiting each waypoint exactly once?

SNNs efficiently optimize via stochastic gradient descent

Neural dynamics descend the gradient

Local minimum
escaped by stochastic
spiking dynamics

Efficient descent due to massively
parallel, asynchronous neuromorphic
computing architecture

Loihi outperforms leading optimization solvers by orders of magnitude

QUBO (Maximum Independent Set)

Workload:

Find largest set of unconnected vertices

Relevance:

- Target of SOTA quantum annealing approaches
- NP hard

Integer Linear Programming (Train Scheduling)

In collaboration with:

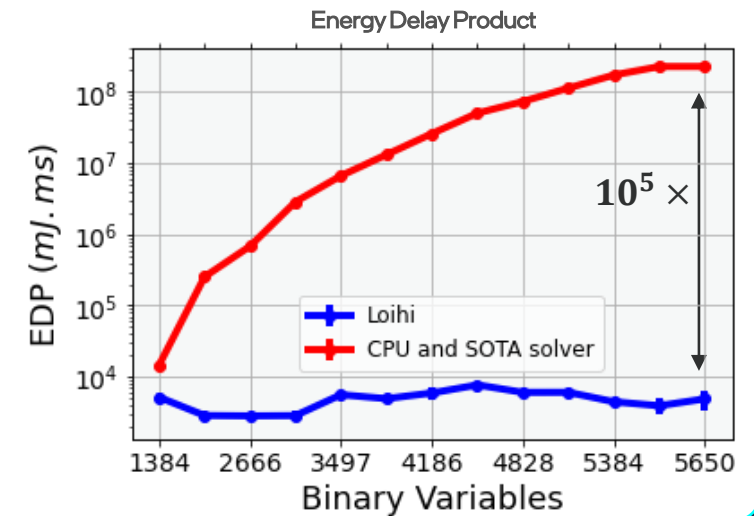

Workload:

Find the largest possible set of route assignments, given customer requests and railway, time and train constraints.

Relevance:

- Large-scale, real-world use case
- Applicable to resource allocation in warehouses and production lines.

Loihi: Nahuku board running NxSDK 0.95 with an Intel Core i7-9700K host with 128GB RAM, running Ubuntu 16.04.6 LTS

QUBO-QBSolv/CPU: benchmarks ran on an Intel Xeon CPU E5-2699 v3 @ 2.30GHz with 32GB DRAM (<https://github.com/dwavesystems/qbsolv>)

ILP-CPU: Xeon-based commercial cloud service as used operationally by DB. Solver runtime was measured; energy consumption estimated based on a 100W TDP estimate.

Performance results are based on testing as of September 2021 and may not reflect all publicly available security updates. Results may vary.

Into a New Era of Neuromorphic Computing

Computational value is proven
(using today's manufacturing tech)

Motivates a new computational paradigm
(cheap, continuous optimization)

Many successful learning algorithms
(albeit shallow so far, not deep)

Properties of suitable applications:

- Power constrained
- Latency constrained
- Process real-time signals
- Slowly evolving structure
- Benefit from shallow online learning
- Apply deep learning for offline training

Outlook to Commercial Value

Scaled up systems

- Acceleration for datacenter optimization workloads
- Recommendation systems
- Scientific computing, HPC

Intelligent Extreme Edge Co-Processors

- Aerospace and robotics devices
- Scene awareness and localization
- Model predictive control
- Navigation and planning
- Consumer devices (longer term)

Specialized Designs

- Audio and other signal processing functions in SoCs
- Sensor integration (e.g. event-based cameras, electronic skins)
- Wireless signal processing and channel optimization
- IP and embedded accelerators for Intel Foundry customers

Today:

General-purpose research chips and software framework

Challenges and headwinds

High cost due to on-chip
memory integration

Algorithms and
Programming models

Software
convergence

A greatly improved Loihi 2 chip

10x Faster

2-10x faster circuits² and design optimizations speed up workloads by up to 10x³

8x More Neurons

Up to 1 million neurons per chip with up to 80x better synaptic utilization, in 1.9x smaller die

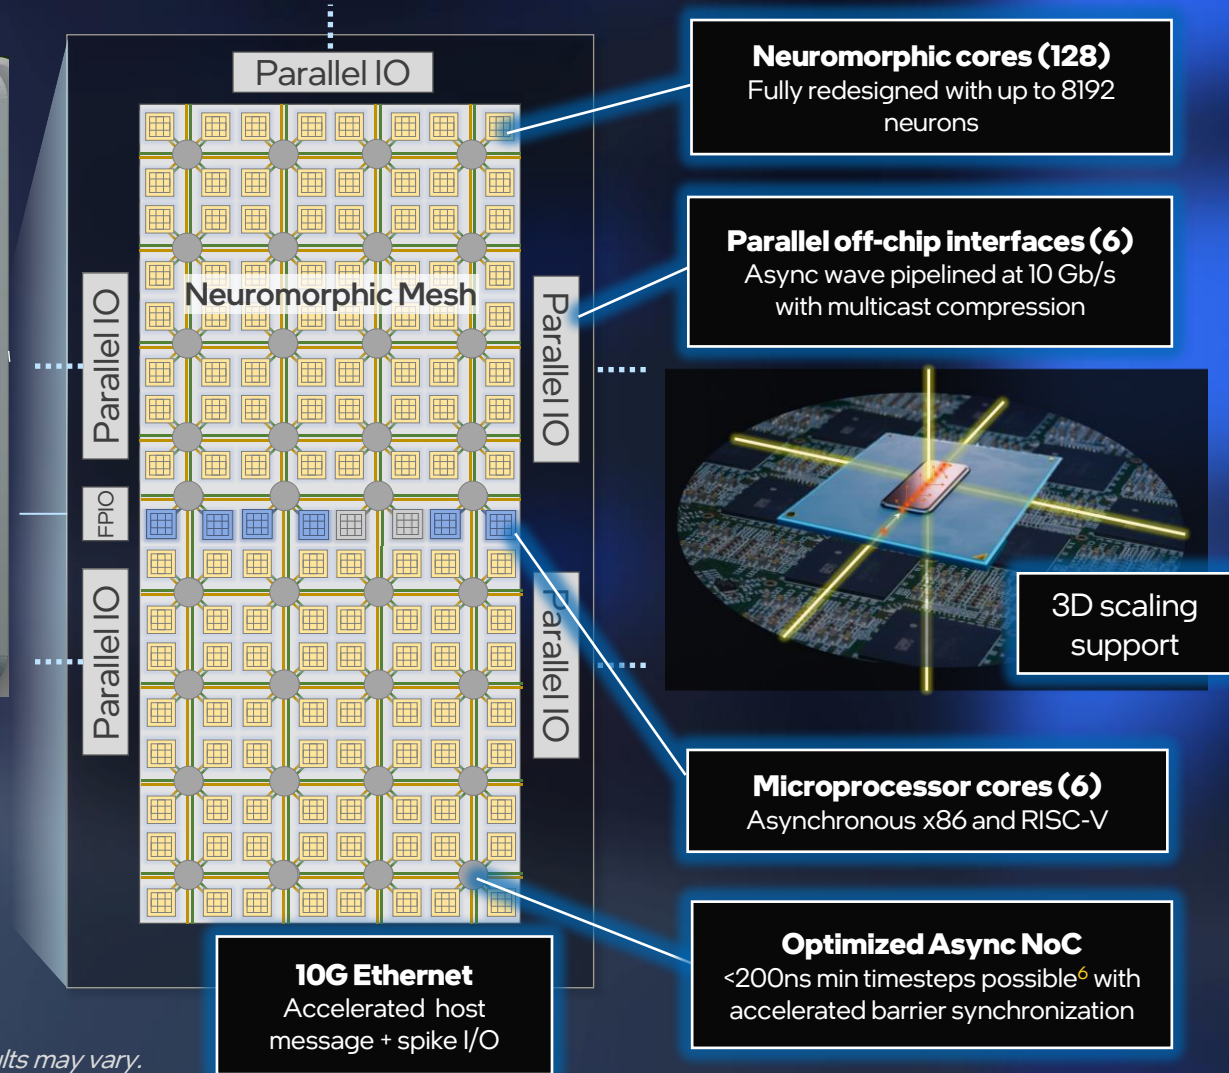

Better Scaling and Integration

3D scaling with 4x more bandwidth per link⁴, >10x compression⁵ with standard interfaces

	Loihi1	Loihi2
Neuron cores:	128	128
Max neurons:	130K	1M
Max synapses:	128M	123M
Max μ P cores:	3	6

^{2,3,4,5,6} See backup for characterization details.. Results may vary.

Neuromorphic cores (128)
Fully redesigned with up to 8192 neurons

Parallel off-chip interfaces (6)
Async wave pipelined at 10 Gb/s with multicast compression

3D scaling support

Microprocessor cores (6)
Asynchronous x86 and RISC-V

Optimized Async NoC
<200ns min timesteps possible⁶ with accelerated barrier synchronization

10G Ethernet
Accelerated host message + spike I/O

Generalized and optimized neuromorphic core

Generalized Spikes

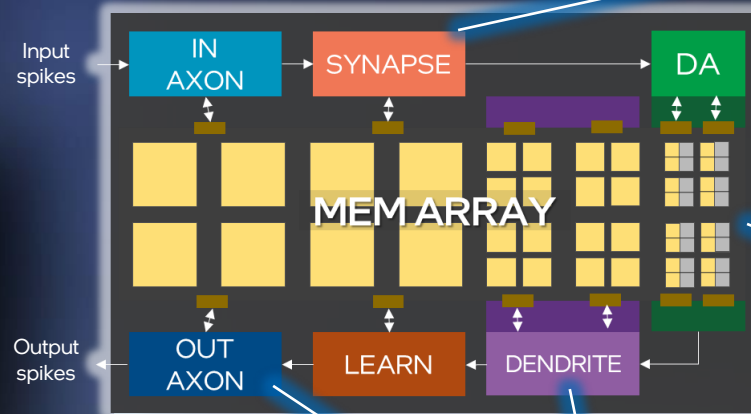

Spikes carry int8 magnitudes for greater workload precision

Programmable Neurons

Neuron models described by microcode instructions

Enhanced Learning

Support for powerful new "three factor" learning rules from neuroscience

Better Synaptic Compression

Convolution
Store kernel instead of connection matrix

Stochastic
up to 80x compression

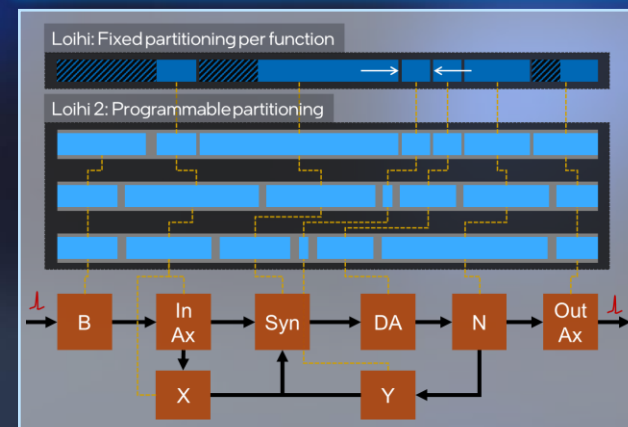

Factorized
 $O(n^2)$ to $O(n)$ compression

Better Utilization of Core Memory

Highly ported centralized async memory array provides resource allocation flexibility

Better Neuron and Routing State Compression

Neuron state
~4x compression vs Loihi 1

Axon Routing
Up to 256x compression vs Loihi 1

Loihi 2 systems and characterization

Oheo Gulch
Single-chip system

Kapoho Point
Stackable 8-chip board

Selected chip measurements

	Loihi 1 ⁷	Loihi 2 ⁶	Improvement
Neuron update time (ns)	9.6	4.4	2.2x faster
Synaptic Op time (ns)	4.0	0.66	6x faster
Minimum timestep (us)	1.57	0.19	8.3x faster
Neuron update energy (pJ)	70	56	25% lower
Synaptic Op energy (pJ)	21	7.8	2.7x lower

^{6,7} See backup for characterization details.. Results may vary.

Deep Learning with Loihi 2

PilotNet: Predict steering wheel angle from dashboard video

Performance Analysis Details

¹ CPU dynamic neural field measurements obtained using repo version of Cedar (<https://cedar.ini.rub.de/>) as of October 2021 running on an Intel Core i7-4720HQ CPU with four threads, 128GB RAM, with Ubuntu 18.04 OS. Loihi 1 simulation measurements obtained using a silicon-calibrated Lava profiling model (unreleased) as of September 2021. Each DNF is a 2D mesh attractor with 27x27 neurons, with one input DNF fanning out to all other DNFs operating in parallel.

² Based on comparisons between barrier synchronization time, synaptic update time, neuron update time, and neuron spike times between Loihi 1 and 2. Loihi 1 parameters measured from silicon characterization (see below); Loihi 2 parameters measured from both silicon characterization with N3B1 revision and pre-silicon circuit simulations using back-annotated timing for Loihi 2.

³ Based on Lava simulations in September, 2021 of a nine-layer variant of the PilotNet DNN inference workload implemented as a sigma-delta neural network on Loihi 2 compared to the same network implemented with SNN rate-coding on Loihi. The Loihi 2 SDNN implementation gives better accuracy than the Loihi 1 rate-coded implementation. Equivalent DNN op counts calculated from a conventional DNN implementation with the same topology and same number of 8-bit parameters.

See Bojarski, Mariusz et al. "End to end learning for self-driving cars." arXiv preprint arXiv:1604.07316 (2016).

⁴ Circuit simulations of Loihi 2's wave pipelined signaling circuits show 800 Mtransfers/s compared to Loihi 1's measured performance of 185 Mtransfers/s.

⁵ Based on analysis of 3-chip and 7-chip Locally Competitive Algorithm examples.

⁶ Loihi 1 measurements were obtained on Oheo Gulch FMC board ncl-og-06 using an internal version of NxSDK advanced from v1.0.0

⁷ Loihi 2 measurements were obtained on Nahuku 32 board ncl-ghrd-01 using NxSDK v1.0.0

The Lava performance model for both chips is based on silicon characterization in September 2021 using the Nx SDK release 1.0.0 with an Intel Xeon E5-2699 v3 CPU @ 2.30 GHz, 32GB RAM, as the host running Ubuntu version 20.04.2. Loihi results use Nahuku-32 system ncl-ghrd-04. Loihi 2 results use Oheo Gulch system ncl-og-04.

Results may vary.
